

**Amendments to the Specification:**

Please replace the paragraph beginning at page 13, line 26, with the following amended paragraph:

[[One]] A first side (9) of the side form member would face the curable material, preferably concrete. ~~The other~~ A second side (7), opposite the first side will be supported by the support members. On the ~~concrete-facing~~ first side the fillets (30, 32) together with the side (9) can act as a mould for the concrete, so that the cured material will have a shape the reverse of the shape of the side form support member. Such a mould would provide concrete having a chamfered rebate edge.
